
Per-point residual threshold crossings — 4x60 tanh, hard IC, 3000 LHS points
(a) First observed threshold crossing (3000 never reached)
collocation points
epoch at which $\|r\|_2 < 10^{-4}$
(b) First observed crossing across the domain
first observed crossing
t
(c) Final vs worst residual per point
$\|r\|_2$
final
worst during training
t
